
Disinfection Channel

With the global outbreak of new coronavirus, the number of people infected continues to rise, we invented aluminum disinfection channel, which integrated face recognition, infrared temperature measurement, disinfection, hand washing and overall disinfection and other functions. It is mainly used in large public places with dense population, such as airports, railway stations, schools, government departments and so on. Aluminum alloy disinfection channels can quickly kill 99.99% of viruses and bacteria in 5 seconds, greatly reducing labor costs in densely populated areas and greatly improving work efficiency.

Because our disinfection channel is made of aluminum alloy, it is a kind of green material with corrosion resistance and no later maintenance cost. Its own performance is far superior to that of iron.

We make this new product mainly for the purpose of public welfare, so the price is very competitive. Please contact us for more details. Thank you!
